Early detection. Proactive intervention.

ScvO$_2$ 70%
Edwards oximetry central venous catheter (CVC) — the first proven CVC with continuous ScvO₂ monitoring — reveals the true adequacy of tissue oxygenation for clarity in early assessment and intervention.

Edwards oximetry central venous catheter continuously monitors central venous oxygen saturation (ScvO₂), an early indicator of compromised or inadequate oxygen delivery.⁶–¹⁰

**Continuous ScvO₂ monitoring**
Proactive management of tissue hypoxia⁶–¹⁰

**Hemodynamic trends**

By providing a more sensitive indicator of oxygen imbalance, Edwards oximetry central venous catheter identifies critical changes earlier than traditional vital signs and intermittent sampling — enabling you to recognize and prevent tissue hypoxia sooner.⁶–¹⁰

Helps guide therapy and provide real-time insight into the efficacy of intervention.⁶,⁷

**Demonstrated prognostic value of continuous ScvO₂ monitoring.**¹¹
- Post-op high-risk surgeries¹²
- Trauma⁹
- Sepsis¹³
- Cardiac failure in congenital heart failure¹⁰
- Recovery in cardiac arrest¹⁴–¹⁵

**Continuous ScvO₂ monitoring has multiple applications in intra- and post-op stages:**¹⁶,¹⁷
- Risk for high blood loss, such as hepatic resections, trauma, vascular cases
- High fluid shifts in gastrointestinal cases
- Toleration of single-lung ventilation in thoracic procedures
- Early indication of failure to tolerate extubation
The advantages of antimicrobial protection and high-pressure injection, together in a single device.\textsuperscript{18,19}

**Oligon integrated antimicrobial protection**
Integrated Oligon antimicrobial material provides enduring antimicrobial protection that will not wash away like antimicrobial coatings. Silver ions (Ag\textsuperscript{+}) are released at a stable rate to attack microbes, alter cell DNA and disrupt cell reproduction. The resulting long-term release of silver into lumens and subcutaneous spaces protects against gram-negative and gram-positive bacteria, fungi and resistant microorganism strains.\textsuperscript{18,19,20}

**High-pressure injection capability**
Edwards oximetry central venous catheter is indicated for high-pressure injection of contrast media for visualization under imaging modalities such as CT, MRI and fluoroscopy.\textsuperscript{18}

For Oligon models only.

Continuous ScvO\textsubscript{2} monitoring reveals the root cause of oxygen imbalance, allowing you to determine appropriate therapy.\textsuperscript{6,21}

**Convenient, accurate and easy to use.**\textsuperscript{6,17,22}

**Edwards oximetry central venous catheter provides:**

- Simplicity and flexibility — uses the same insertion techniques as central lines\textsuperscript{22}
- Continuous ScvO\textsubscript{2}, monitoring, pressure monitoring and fluid resuscitation\textsuperscript{2,18}
- Accurate oxygenation status\textsuperscript{2,4}
See clearly. Stay ahead.

Designed for use with Edwards’ monitoring platforms, Edwards’ oximetry central venous catheters offer the clarity of an early warning to support early intervention.

Edwards Oximetry Central Venous Catheter with Integrated Oligon Antimicrobial Protection

Early assessment with real-time ScvO₂ monitoring enables you to make proactive clinical decisions for your high-risk patients.⁶,⁷

Edwards EV1000 Clinical Platform

Presents patient physiologic status in an intuitive, meaningful way to clinically support proactive hemodynamic management.

PediaSat Oximetry Catheter

The first and only pediatric oximetry catheter with continuous ScvO₂ monitoring to help you stay ahead of hypoxia and stages of sepsis.¹¹,²³–²⁵

For over 40 years, Edwards Lifesciences has been helping you make proactive clinical decisions to advance the care of surgical and critical care patients.

Through ongoing collaboration with you, ongoing education and our never-ending quest for advancement, Edwards develops solutions that provide the clarity to make proactive clinical decisions.

20. Edwards Oligon Oximetry Catheters contain an integrated Oligon antimicrobial material. The activity of the antimicrobial agent is localized at the catheter surfaces and is not intended for treatment of systemic infections. In vitro testing demonstrated that the Oligon material provided broad-spectrum effectiveness (≥ 3 log reduction from initial concentration within 48 hours) against the organisms tested: Staphylococcus aureus, Staphylococcus epidermidis, Klebsiella pneumoniae, Enterococcus faecalis, Candida albicans, Escherichia coli, Serratia marcescens, Acinetobacter calcoaceticus, Corynebacterium diphtheriae, Enterobacter aerogenes, GMRSa, Pseudomonas aeruginosa, Candida glabrata and VRE (Enterococcus faecium).
