The practical solution for managing perfusion

Smart. Innovation.

FloTrac system
**FloTrac system:**
4.5 million patients, 86 countries and 10+ years.*

**Trusted**

Chosen to monitor over
4.5 Million Patients

**Worldwide**

86 Countries. Used by clinicians
worldwide for minimally-invasive
volume management

**Literature**

Referenced in over 270+
clinical studies spanning
the OR and ICU

*Data on file

FloTrac system algorithm

*Provides a clear hemodynamic picture
across various patient conditions and
surgical procedures

Compensating for patient-to-patient differences in vasculature,
real-time changes in vascular tone and differing arterial sites.

The FloTrac system algorithm is based on the principle that
aortic pulse pressure (PP) is proportional to stroke volume (SV)
and inversely related to aortic compliance.

The algorithm compensates for the effects of compliance on PP
based on age, gender, and body surface area (BSA).
The minimally-invasive FloTrac system is a reliable solution for advanced hemodynamic monitoring that automatically calculates key flow parameters every 20 seconds.

The FloTrac sensor attaches to an existing arterial line and monitors advanced hemodynamic parameters:

- Stroke volume (SV)
- Stroke volume variation (SVV)
- Mean arterial pressure (MAP)
- Cardiac output (CO)
- Systemic vascular resistance (SVR)

Proactive decision support offered by the FloTrac system helps guide individualized treatment decisions for your moderate- to high-risk surgery patients, and can be utilized perioperatively to proactively manage your patients. The FloTrac system can also be utilized to manage physiological status in rapidly changing clinical situations in acute care settings.

With the FloTrac sensor and HemoSphere monitor, you can see your patient’s physiologic status and analyze trends with exceptional clarity allowing you to intuitively navigate with a simple-to-use touchscreen.
Proactively manage pressure and flow component of perfusion.

The FloTrac system provides access to pressure and flow parameters to help you evaluate hemodynamic instability including hypotension and guide appropriate treatment.

Recent studies show associations between intraoperative hypotension and increased risk of acute kidney injury (AKI) and myocardial injury — the leading cause of post-operative mortality within 30 days after surgery.

Clarity through advanced hemodynamic monitoring parameters CO, MAP, SV, SVV and SVR provided by the FloTrac system can help you determine if the cause of intraoperative hypotension is preload, afterload, or contractility.

If the underlying cause of hemodynamic instability is related to flow generation, continuous parameters, offered by the FloTrac system, can help you determine appropriate fluid therapy.

Continuous assessment of pressure and flow parameters offers decision support to help manage the duration and severity of intraoperative hypotension episodes.
Manage the flow component of perfusion to guide individualized fluid management.

When managing perfusion, stroke volume can be optimized using the patient’s own Frank-Starling curve.

The patient’s location on the curve can be determined by measuring changes in SV in response to change in preload using a fluid bolus challenge or passive leg raise (PLR). Dynamic, flow-based parameters are more informative than conventional parameters in determining fluid responsiveness and may help guide individualized volume administration in patients and avoid excessive and insufficient volume administration.¹

Manage variability in volume administration.
Advanced hemodynamic parameters provided by the FloTrac system may be used in perioperative goal-directed therapy (PGDT) protocols. PGDT is a treatment protocol using dynamic, flow-based parameters with the objective of making the appropriate volume management decisions. PGDT can be implemented in a single procedure or as part of a larger initiative such as Enhanced Recovery After Surgery pathways.
Enabling proactive clinical decisions.

For more than 50 years, Edwards Lifesciences has been helping you make proactive clinical decisions and advance the care of surgical and acutely ill patients across the continuum of care.

Through ongoing collaboration with clinicians, providing continuous education, and our dedication to purposeful innovation, Edwards continues to develop smart hemodynamic management solutions that enable proactive decision support.
